## MATH 551 HOMEWORK 8

## DUE WEDNESDAY, NOVEMBER 9

You are encouraged to work on the homework together, but your final write-up should be your own. Please write down on your homework the name of any collaborators. No late homework will be accepted. "Hungerford I.1.3" means Question 3 in the exercises at the end of Section 1 of Chapter 1.

- (1) Let R be a commutative ring with identity  $1_R$ .
  - (a) Show that the ideal  $\langle a_1, \ldots, a_n \rangle$  for  $a_i \in R$  is  $\{r_1a_1 + \cdots + r_na_n : r_i \in R, 1 \le i \le n\}$ . (Do not cite results from the book we have not discussed in class).
  - (b) Let A be an R-module, and let B be the (left) submodule generated by  $a \in A$ . Show that  $B = \{ra : r \in R\}$ .
  - (c) Give a counterexample to the first part if R is not commutative. Did you need commutativity in the second part?
- (2) Give an example of a ring R and two sets  $A, B \subseteq R$  for which  $AB \neq \{ab : a \in A, b \in B\}.$
- (3) Let R be a ring with identity. An R-module A is cyclic if it is generated by one element. Show that a cyclic R-module is isomorphic to R/J, where J is a left ideal of R.
- (4) Hungerford IV.1.5
- (5) Hungerford IV.1.9. What linear algebra concept does this generalize?
- (6) Fall 2002 Let p be an odd prime, and let R be the ring of "p-quarternions"; that is

$$R = \{a_0 + a_1 i + a_2 j + a_3 k : a_n \in \mathbb{Z}/p\mathbb{Z} \text{ for } n = 0, 1, 2, 3, \text{ and } \}$$

$$i^{2} = j^{2} = k^{2} = -1, ij = k = -ji, jk = i = -kj, ki = j = -ik$$

Show that R is a simple ring, so the only two-sided ideals of R are the zero ring and R itself.
